Building Reports, Dashboards, and Custom Pages (UI Builder)

Vehicle Service Request Form

1. Aim

To build supporting Reports and a UI Builder Dashboard Page for the existing “Vehicle Service Request Form” application in Zoho Creator, allowing a service manager to view, filter, and triage submitted repair requests, and allowing service status and vehicle-wise trends to be monitored from a single unified screen.

2. Procedure

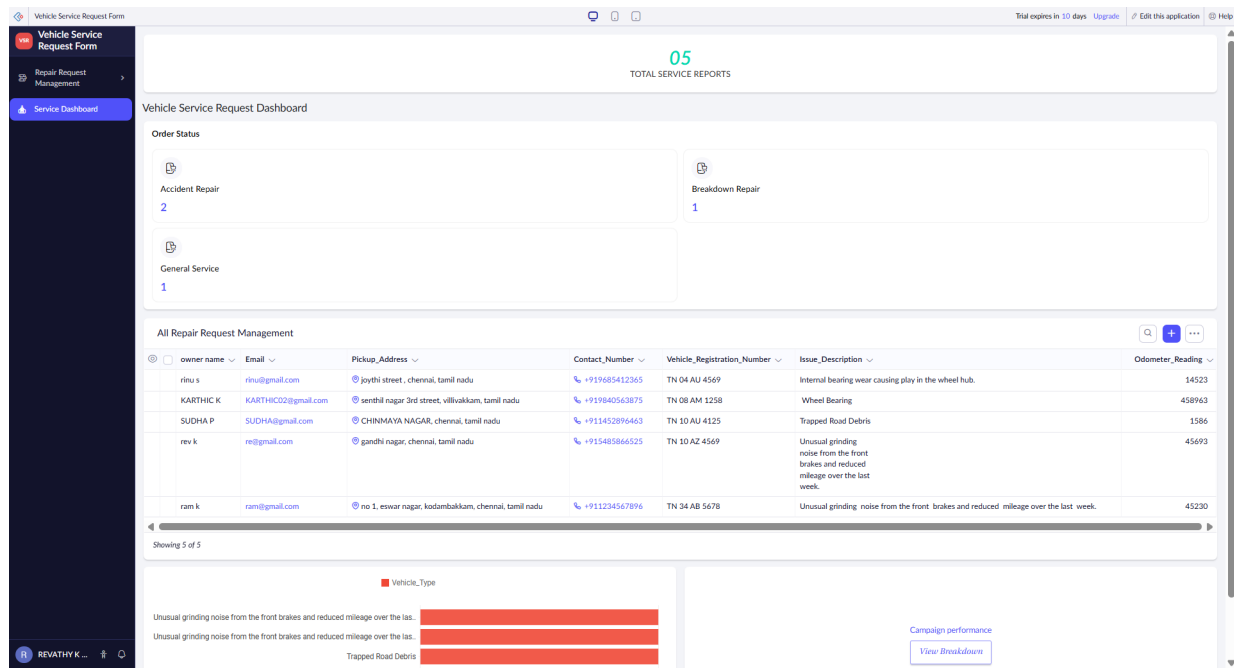

2.1 Building the Reports

1. Open Reports in the left sidebar; Zoho Creator auto-generates a grid report from the form. Rename it “All Repair Request Management”, listing owner name, email, pickup address, contact number, vehicle registration number, issue description, and odometer reading for every request.
2. Create a second report, group it by the Vehicle_Type field, and name it “Vehicle Type Report” so requests are organized into Hatchback, Sedan, SUV, MUV, and Pickup Truck columns, making it easy to see which vehicle categories are generating the most service requests.
3. Create a third report, “Service Report”, that consolidates owner name, contact number, email, pickup address, vehicle registration number, issue description, and odometer reading into a single scrollable table for the service desk to review at a glance.

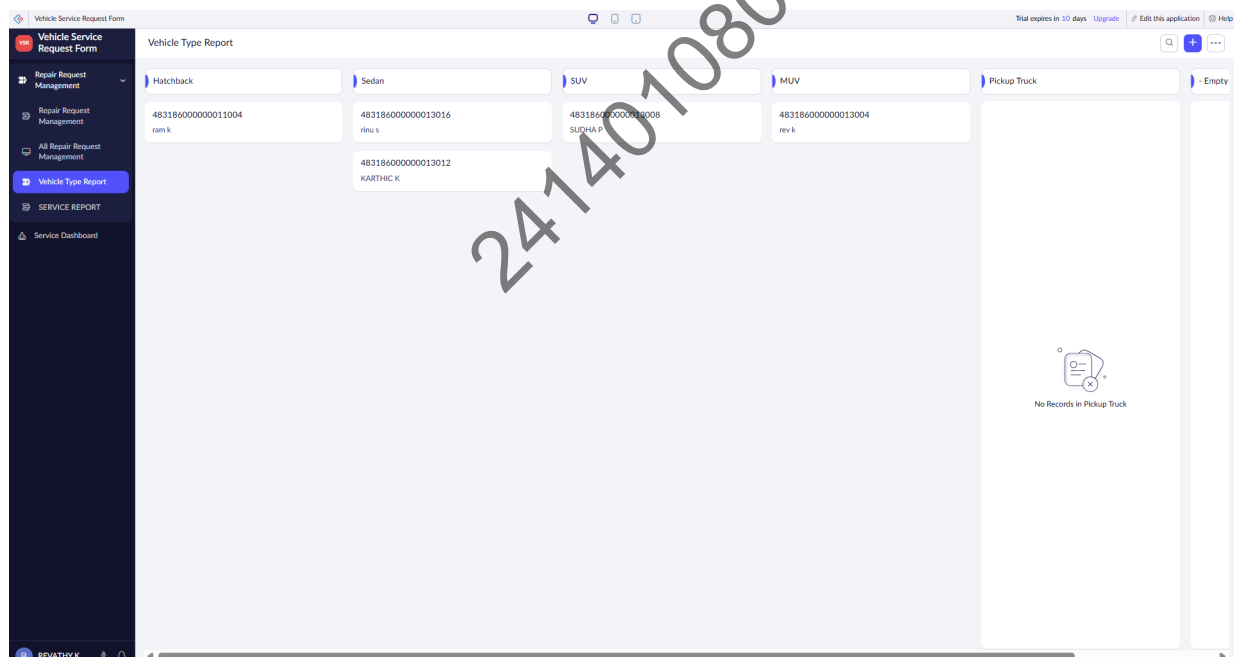

2.2 Building the Dashboard Page (UI Builder)

1. Go to Pages under UI Builder → click New Page → choose Blank Page → name it “Service Dashboard.”
2. Add a heading component titled “Vehicle Service Request Dashboard” along with a summary tile showing the Total Service Reports count.
3. Add three status cards — Accident Repair, Breakdown Repair, and General Service — each linked to a count of the matching repair requests, so the service manager can gauge order status at a glance.
4. Drag in the “All Repair Request Management” report so every request, along with owner, contact, and vehicle details, is visible directly on the dashboard.
5. Add a Chart Component plotting Vehicle_Type against Issue_Description, to visualize which issues occur most often for each vehicle type.
6. Arrange the layout top to bottom: heading and summary → order status cards → all repair requests table → issue-by-vehicle-type chart.
7. Preview the page to confirm the report loads with the correct counts, the chart renders correctly, and each report link opens the right view.
8. Check Form, Report, and Page permissions under Settings for each user role, ensuring the intended roles have View/Add access.
9. Publish the page and, if required, set “Service Dashboard” as the default landing page under App Settings → Pages.

3. Output

Service Dashboard – order status, all repair requests, and issue distribution chart

Vehicle Type Report – repair requests grouped by Hatchback, Sedan, SUV, MUV, and Pickup Truck

Service Report – consolidated view of owner, contact, and vehicle service details

241401080

4. Result

An “All Repair Request Management” report, a “Vehicle Type Report” grouped by vehicle category, and a “Service Report” were built alongside a consolidated “Service Dashboard” page using UI Builder for the existing Vehicle Service Request Form application. This enables the service manager to view repair request patterns at a glance, track order status by repair type, and review every request from a single unified screen, ensuring each vehicle service request is captured as a structured, trackable digital record before assignment to a technician.
