

VEHICLE SERVICE REQUEST MANAGEMENT

EXPERIMENT 6: Workflow Automation using Deluge

Name	Revathy K
Roll No	241401080
Department	CSBS

Workflow Automation using Deluge — Vehicle Service Request Form

1. Aim

To automate the approval and notification process of the "Vehicle Service Request Form" application in Zoho Creator using Deluge scripting, so that every repair request submitted by an owner is automatically routed for review, and the concerned owner is notified by email the moment the request is approved or rejected — without any manual intervention from the service desk.

2. Procedure

2.1 Creating the Approval Workflow

1. Open the **Workflow** tab of the Vehicle Service Request Form application and go to the **Approvals** section. Choose the form "Repair Request Management" on which the approval process must run.
2. On the "Run approval process on record addition" screen, select the form, name the workflow (for example "Repair Request Management"), and set the process to run **Always** so that every new record automatically enters the approval chain.

Run approval process on record addition

Choose form

Name the workflow

Run this process ☒ Always ☐ On condition

[Create Workflow](#)

Explanation: This screen configures the approval trigger. Selecting the "Repair Request Management" form and setting the run condition to "Always" ensures that as soon as a vehicle owner submits a new service request, the record is automatically pushed into the approval pipeline for the service manager's review, with no separate condition needed to activate it.

3. In parallel, a form-level workflow is created under "Run workflow on any event in the form" so that field validations and record-level actions (create/edit/delete) can also trigger Deluge scripts independently of the approval chain.

Run workflow on any event in the form

Choose form

Run when a record is
(Record Event) ☐ Created ☐ Edited ☐ Created or Edited ☐ Deleted

When to trigger workflow
(Form Event)

Name the workflow

[Create Workflow](#)

Explanation: This screen lets the workflow fire on a chosen **Record Event** (Created, Edited, Created or Edited, or Deleted) combined with a **Form Event** such as validation on submission. Naming it (e.g. "Notify Customer") keeps the automation organised and identifiable on the Workflow dashboard.

2.2 Choosing the Trigger and Writing the Deluge Script

4. When adding a new action, Zoho Creator asks "When do you want to run your action?". The options available are On a form event, On a scheduled date, On a function call, On batches of records, On an approval activity, On a payment activity, and On a business process. For this automation, **On an approval activity** is selected so the script executes right after a request is approved or rejected.

Explanation: Each trigger type maps to a different real-world moment. Choosing "On an approval activity" ties the Deluge script directly to the outcome of the approval step (Level 1 Approved / Level 1 Rejected), instead of running on every save, which keeps notifications limited to genuine status changes.

5. In the **Approvals** tab, the "Repair Request Management" approval named "request approval" branches into an **On Start**, a **Level 1 Approved** path, and a **Level 1 Rejected** path. Each approved/rejected path is attached to Deluge scripts that send a mail to \${Email} and push an in-app notification to the reviewer, e.g. revathy.k.2024.csbs@...

Explanation: This is the core of the automation. The Deluge scripts under "Level 1 Approved" send an email to the vehicle owner and an internal notification confirming the request has been accepted for service, while the script under "Level 1 Rejected" sends a rejection mail instead — so the correct notification fires automatically depending on the reviewer's decision, with 3 actions enabled overall for this approval.

3. Output

Once the approval workflow and its Deluge scripts were published, every repair request submitted through the Vehicle Service Request Form began flowing through the automated approval chain, with the service manager able to track pending and completed reviews from dedicated tabs.

Form Workflows

Explanation: The **Form workflows** list under the Workflow tab shows two automations running on the "Repair Request Management" form: one with 3 actions triggered on "Created > Validations on form submission", and another with 1 action triggered on "Created or Edited > Successful form submission" that sends a confirmation mail to the address captured in the `#{Email}` field. Both are marked **Enabled**, confirming the automations are live on the form.

Explanation: Opening the "3 Actions" link on that workflow shows the individual Deluge scripts attached to it. All three actions are Deluge scripts, kept as separate, independently editable steps — for instance validating input, sending an acknowledgement mail, and updating the odometer reading — which together make up the complete automation output for that form event.

Pending Tasks

Explanation: The "Pending Tasks" screen under Approvals lists every repair request that is still awaiting a Level 1 review — here requests from owners Kathiravan R, Achu V, and Sudha P are shown, each with the owner name, contact number, and email that the Deluge script will use once a decision is made, confirming that the "On Start" trigger correctly queued each new record for approval.

Completed Tasks

Explanation: The "Completed Tasks" screen shows the same requests after a reviewer has acted on them — Sudha P's request was reviewed (rejected, shown with a red marker) and Akshatha R's request was reviewed (approved, shown with a green marker). This confirms that the Level 1 Approved and Level 1 Rejected Deluge scripts executed correctly, moving each record out of Pending Tasks and triggering the corresponding mail/notification action automatically.

4. Result

An approval-driven workflow automation was successfully built for the "Vehicle Service Request Form" application using Deluge scripting in Zoho Creator. Every new repair request is automatically queued for Level 1 review, and Deluge scripts attached to the Level 1 Approved and Level 1 Rejected branches automatically send an email and an in-app notification to the concerned owner and reviewer. This eliminates manual follow-up, ensures every service request is reviewed in a consistent, traceable manner, and keeps both the requester and the service desk informed in real time about the status of each vehicle repair request.
